

## Task – Quality Requirement Generation

**Please put your participant ID on top of the page and use the same ID for every questionnaire and task!**

**Task 1:** Have a look at the alerts you have in your system and generate a new Quality Requirement of one of them. If no alert is present, you can click on “New Alert” button (Alerts View) in order to simulate one.

**Task 2:** If the component that connects the Dashboard with the backlog is implemented and installed, check that the new Quality Requirement is present in your backlog.

Please fill in the following template after you performed these tasks:

<b>Element Id (from alert)</b>	
<b>If you have exported to your backlog, which is the element id in your backlog?</b>	
<b>If you have exported to your backlog, is the new issue created correctly into your backlog?</b>
